1 Product description

1.1 Function introduction

BL0942 is a calibration-free energy metering chip with a built-in clock, suitable for single-phase multi-function energy meters, smart sockets, smart home appliances and other applications, with high cost performance.

BL0942

BL0942 integrates 2- way high-precision Sigma-Delta ADC , analog circuit modules such as reference voltage, power management, and digital signal processing circuits for processing electrical parameters such as active power, current and voltage RMS.

BL0942 can measure parameters such as current, voltage RMS, active power, active energy, etc., and can output fast current RMS (for overcurrent protection), as well as waveform output and other functions, and output data through UART/SPI interface, which can fully meet the requirements of intelligent The needs of fields such as sockets, smart home appliances, single-phase multi-function electric energy meters, and big data collection of electricity consumption information.

BL0942 has a patented anti-creep design, combined with a reasonable external hardware design, it can ensure that the noise power is not included in the energy pulse when there is no current.

1.2 main feature

- Two independent Sigma-Delta ADCs, one current and one voltage.
- RMS current range (10mA~30A) @1mohm
- Active energy (1w~6600w) @1mohm@220V
- Can output current, voltage RMS, fast current RMS, active power
- The batch factory gain error is less than 1%, and the external components can be exempted from calibration if they meet certain conditions
- The current channel has an overcurrent monitoring function, and the monitoring threshold and response time can be set
- Voltage / current zero-crossing signal output
- Built-in waveform register, which can output waveform data for load type analysis
- SPI (the fastest rate supports 900KHz) /UART (4800-38400bps) communication method (TSSOP14L Package supports up to 4 slice cascading

- Power down monitoring, below 2.7V, the chip enters the reset state
- Built-in **1.218V** reference voltage source
- Built-in oscillation circuit, the clock is about 4MHz
- Chip single working power supply 3.3V, low power consumption 10mW (typical value)

BL0942

• SSOP10L/TSSOP14L encapsulation

Figure 2

Pin Description (SSOP10L)

pin	symbol	illu							
No		stra							
		te							
1	VDD	Power supply (+3.3V)							
2,3	IP,IN	Current channel analog input, the maximum differential							
		voltage of the pins is ±42mV (30mV rms)							
4	VP	Voltage signal input terminal, maximum differential							
		voltage ±100mV (70mV rms)							
5	GND	chip ground							
6	CF1	Power status output, which can be configured by the							
		OT_FUNX register to output a variety of power information							
7	SEL	UART/SPICommunication mode selection (0: UART 1:							
		SPI), internal pull-down resistor,							
		Floating is 0 level (UART), and the pin is directly connected							
		to VDD to be high level (SPI)							
8	SCLK_BPS	SPI mode clock input, selectable baud rate in UART mode							
9	RX/SDI	UART/SPI multiplexing pin, UART RX/SPI DIN, external pull-							
		up is required in UART mode							
		resistance							
10	TX/SDO	UART/SPI multiplexed pin, UART TX/SPI DOUT, needs to be							
		connected externally in UART mode							
		pull resistor							

Pin Description (TSSOP14L)

in	a semb a 1	illu							
pin	symbol								
number		stra te							
1	VDD	Power supply (+3.3V)							
2,3	IP,IN	Current channel analog input, the maximum differential voltage							
		of the pins at the default gain of $16 \text{ is } \pm 42 \text{mV}$ (30mV							
		rms) ;							
4	VP	Voltage signal input terminal, maximum differential voltage							
		±100mV (70mV rms)							
5	GND	chip ground							
6	A1	UART mode, it is used as the low address of the chip select							
		function. Internal default dropdown.							
7	A2_NCS	UART mode, it is used as the high address of the chip select							
		function. In SPI mode, as CS chip select control,							
		Active low. Internal default dropdown.							
8	CF2	Power status output, which can be configured by the OT_FUNX							
		register to output a variety of power information							
9	ZX	The zero-crossing monitoring output pin can be configured by							
		the OT_FUNX register to output a variety of electric energy							
		information							
10	CF1	Power status output, which can be configured by the OT_{FUNX}							
		register to output a variety of power information							
11	SEL	UART/SPI Communication mode selection (0: UART 1: SPI),							
		there is a pull-down resistor inside , and it is

2 Functional description

BL0942 is mainly divided into two parts: analog signal processing and digital signal processing. The analog part mainly includes two-channel PGA, two-channel Sigma-Delta ADC, built-in clock (internal clock), power on/reset (Power on/reset), LDO and other related analog module, and the digital part is a digital signal processing module (DSP).

BL0942

2.1 Current and voltage transient waveform measurement

Figure 4

As shown in the figure above, the current and voltage pass through the analog module amplifier (PGA) and high-precision analog-to-digital conversion (ADC) respectively to obtain two 1-bit PDMs for the digital module, and the digital module passes through the down-sampling filter (SINC3) , high-pass filter (HPF) , channel offset correction and other modules to obtain the required current waveform data and voltage waveform data (I_WAVE, V_WAVE) .

The collected load current and voltage waveform data are updated at a rate of 7.8k, each sampled data is a 20bit signed number, and stored in the waveform register (I_WAVE, V_WAVE) respectively, the SPI rate configuration is greater than 375Kbps, and one channel can be read continuously waveform value.

Note: The register is 24bit,	if the number	of digits is i	insufficient, high bits are
filled with zeros.

2.2 active power

addres s	name	Signif icant bit	Defaults	describe
0x06	WATT	twenty four	0x000000	Active power register, signed

BL0942

Active power calculation formula : WATT =

 $\frac{3537*I(A)*V(V)*COS}{(\phi)}$ *Vref*²

Among them, I(A), V(V) is the effective value (mV) of the channel pin input signal, φ is the phase angle of the I(A) and V(V) AC signals, Vref is the built-in reference voltage, typical value 1.218V;

This register indicates whether the current active power is positive or negative, Bit[23] is the sign bit, Bit[23]=0, the current power is positive power, Bit[23]=1, the current power is negative power, complement code form.

2.3 Active power anti-creep

BL0942 has a patented power anti-submersion function, which ensures that the board-level noise power will not accumulate power when there is no current input.

The active anti-creep threshold register (WA_CREEP), is an 8bit unsigned number, and the default is OBH. The corresponding relationship between this value and the active power register value is shown in the following formula. When the absolute value of the input active power signal is less than this value, the output active power is set to 0. This can make the value output to the active power register be 0 in the case of no load, even if there is a small

noise signal, and the electric energy will not accumulate.

addres s	name	Signif icant bit	Defaul ts	describe
0x14	WA_CREEP	8	0x0B	Active power anti- passage register

BL0942

WA_CREEP can be set according to the value of the power register WATT, and their corresponding relationship:

$$WA_CREEP = WATT * \frac{256}{3125}$$

Note: When the current channel is in the anti-skid state, the current RMS value of this channel is not measured, and it is also cut to $\mathbf{0}$.

2.4 Energy Metering

BL0942 provides electric energy pulse metering, the active instantaneous power is integrated according to time, the active energy can be obtained, and the calibration pulse CF can be further output. The CF_CNT register stores the number of output energy pulses CF, as shown in the figure below.

BL0942

				accumulation	

CF_EN is the main switch for energy pulse output. After it is turned off, CF_CNTstops counting, and CF1/CF2/ZX pins stop outputting energy pulses for counting.Shanghai Belling Corp., Ltd.V1.0523/31

The CF_CNT_CLR_SEL register can be used to select whether the CF count register (CF_CNT) is cleared after reading. accessible

BL0942

 $\mathsf{CF_CNT_ADD_SEL}\xspace$ selects the pulse energy accumulation mode.

Note: The **CF_CNT** register defaults to the energy pulse absolute value accumulation method.

each CF pulse t_{CF} =

1638.4*256 WATT

Where WATT is the corresponding active power register value (WATT).

2.5 RMS value of current and voltage

The effective values of the current and voltage channels are shown in the figure below, after a square circuit (X²), a low-pass filter (LPF_RMS), a root-opening circuit (ROOT), get the instantaneous value RMS_t of the effective value, and then get the average value (I_RMS and V_RMS) of the two channels after averaging.

BL0942

Figure	7
1 1 9 9 1 0	

addr ess	name	Signif icant bit	Defaults	describe
0x03	I_RMS	twenty four	0x000000	Current RMS register, unsigned

No.	name	default value	des	cription	
[3]	RMS_UPDATE_SEL	0b0	When the rms register is refreshed	0 : 400ms 1 : 800ms	
			time setting		

Set MODE[3].RMS_UPDAT_SEL, you can choose the average refresh time of the effective value to be 400ms or 800ms, and the default is 400ms. When the channel is in the anti-submarine state, the effective value of the current channel is zero.

Current RMS conversion formula: I_RMS =

Vref

Voltage RMS conversion formula: V_RMS = 73989*V(V) Vref

 Vref is the reference voltage, the typical value is 1.218V.

Note: $I(A) \mbox{ is the input signal (<math display="inline">mV \mbox{)} \mbox{ between } IP \mbox{ and } IN \mbox{ pins, } V(V) \mbox{ is the input signal (} mV \mbox{)} \mbox{ of } VP \mbox{ pin }.$

$2.6 \, \text{overcurrent} \, \, \text{detection}$

BL0942 can quickly collect the effective value of the current to realize the function of over-current detection. After I_WAVE_F takes the absolute value, it accumulates the half-cycle or cycle time, stores it in the I_FAST_RMS register, compares it with the current fast RMS threshold register I_FAST_RMS_TH, and outputs an over-current interrupt through the pin.

BL0942

addres s	name	Signif icant bit	Defaul ts	describe
0x15	I_FAST_RMS_TH	16	OxFFFF	Current Fast RMS Threshold Register

Set the fast RMS threshold (that is, the overcurrent threshold) through the $I_FAST_RMS_TH$ fast RMS threshold register.

addr ess	name	Signif icant bit	Defaults	describe
0x05	I_FAST_RMS	twenty four	0x000000	Current fast rms, unsigned

Compare Bit[23:8] of the I_FAST_RMS register with the overcurrent threshold I_FAST_RMS_TH [15:0]. If it is greater than or equal to the set threshold, the overcurrent alarm output indicator pin CF1/CF2/ZX outputs a high level. CF1/CF2/ZX are set by OT_FUNX output configuration register.

BL0942

through the I_FAST_RMS_CYC fast effective value refresh cycle register. Among them, Zhou Bo is based on

The setting value of MODE[5] can be 50H or 60Hz. If you choose 50hz, the default is 1 cycle, that is, refresh every 20ms. For example, choose the fastest 0.5

When the cycle is accumulated, the error of the ${\sf I_FAST_RMS}$ register will be relatively large.

$I_FAST_RMS \approx I_RMS * 0.363$

It should be noted that the algorithm of fast effective value and effective value is different. The fast effective value is only used for measurement judgment when the signal is large. Fast rms measurements will be inaccurate due to the inclusion of DC bias components at small signals. If it is desired to remove the DC bias component, set FAST_RMS_SEL(MODE[4])=1, I_WAVE_F selects the waveform after HPF.

Set AC frequency by $\ensuremath{\mathsf{MODE[5]}}\xspace.$

2.7 Zero-crossing detection

Shanghai Belling Corp., Ltd.

BL0942 provides voltage and current zero-crossing detection, and the zero-crossing signal can be output by the pin CF1/CF2/ZX. The pin output zero indicates the positive half cycle of the waveform, and the pin output 1 indicates the negative half cycle of the waveform. The time delay with the actual input signal is 570us.

BL0942

Configure the output pins through OT_FUNX (the SSOP10L package only has CF1).

0x19	STATUS	working status register				
No.	name	default value description				
[8]	I_ZX_LTH_F	0b0	Current zero- crossing	0 : Current zero crossing is above threshold		
			output state status indication	1: current zero crossing is lower than the threshold		
[9]	V_ZX_LTH_F	0b0	Voltage zero- crossing	0 : Voltage zero crossing is higher than the threshold		
			output state status indication	1 : Voltage zero crossing is lower than the threshold		

If the voltage or current RMS value is too low, the zero-crossing detection output signal is unstable.

BL0942

When the voltage effective value $V_R MS$ High 5 bit it equal to $0V_ZX_LTH_F_If$ it is 1, it means that the effective value of the voltage is too low, less than 1/3 2 of the full scale, and the zero-crossing indicator of the voltage is turned off and remains at 0.

RMS current $I_RMS_high 6b it equal 0, I_ZX_LTH_F for 1$, it means that the effective value of the current is too low, less than the full scale 1/64, the current zero-crossing indicator is turned off and remains at 0.

2.8 Line voltage frequency detection

BL0942 has a line voltage frequency detection function, which is refreshed every several set cycles (FREQ_CYC), and what is detected is a full-wave voltage waveform.

BL0942

addres s	name	Signif icant bit	Defaults		describe
0x08	FREQ	16	0x4e20	L	ine voltage register, unsigned
					e Voltage Refresh Time Setting gister
0x17	FREQ_CYC	2	0x3	00	2 cycles refresh
	_			01	4 cycles refresh
				10	8 cycle refresh
				11	16 cycle refresh

The resolution of line voltage measurement is 2us/LSB (500KHz clock), which is equivalent to 0.01% at 50Hz line frequency or 0.012% at 60Hz line frequency. The conversion relationship between the line voltage register (FREQ) and the actual line voltage frequency:

$$f_{\text{test}} = \frac{2 * f_s}{FREQ}$$

Among them, $fs{=}500 KHz\,in\,default\,mode\,;$ for $50 Hz\,mains$ network, the measured value of FREQ is $20000\,(\,{\rm decimal}\,)\,,$ for 60 Hz

The mains network, the measured value of $\ensuremath{\mathsf{FREQ}}\xspace$ is 16667 (decimal).

In addition, when the voltage RMS value is lower than the zero-crossing judgment threshold, the line voltage frequency detection is turned off.

3 Communication Interface

BL0942 provides two communication interfaces, SPI and UART, which are multiplexed. The register data is sent in 3 bytes (24bit). For the register data less than 3 bytes, the unused bits are filled with 0, and 3 bytes are sent.

BL0942

3.1 SPI

- via pin SEL option, with the UART Multiplexing, SEL=1
- work in slave mode
- Half-duplex communication, the communication rate can be configured, the maximum communication rate is 900Khz
- 8-bit data transfer, MSB First, LSB is behind
- Fixed a clock polarity / phase (CPOL=0, CPHA=1)
- Three-wire or four-wire communication, when A2_NCS fixed connection O When, it is equivalent to three-wire communication, when A2_NCS When controlled by the host, it is equivalent to four-wire communication.

3.1.1 Operating mode

The master device works in Mode1: CPOL=0, CPHA=1, that is, in the idle state, SCLK is at low level, and the data is sent on the first edge, that is, the transition of SCLK from low level to high level, so the data Sampling is on the falling edge and data transmission is on the rising edge.

3.1.2 frame structure

In the communication mode, first send 8bit identification byte (Ox58) or (OxA8), (Ox58) is the identification byte of read operation, (OxA8) is the identification byte of write operation, and then send the register address byte to decide to access the register address (see BL0942 Register List). The figure below shows the data transfer sequence for read and write operations, respectively. After one frame of data transmission is completed, BL0942 re-enters the communication mode. The number of SCLK pulses required for each read / write operation is 48 bits.

BL0942

There are two frame structures, which are described as follows:

1) Write operation frame

Write CMD	Register Address	Data_H	Data_L	Checksum
1 0 1 0 1 0 0 0	A A A A A A A A A 7 6 5 4 3 2 1 0	D D D D D D D D D D 7 6 5 4 3 2 1 0	D D D D D D D D D 7 6 5 4 3 2 1 0	D D <thd< th=""> <thd< th=""> <thd< th=""> <thd< th=""></thd<></thd<></thd<></thd<>

Among them, the checksum byte CHECKSUM is ((OxA8 + ADDR + Data_H + Data_M + Data_L) &

OxFF) and then reversed bit by bit. 2) Read operation frame

Among them, the checksum byte CHECKSUM= ((0x58 + ADDR + Data_H + Data_M + Data_L) & 0xFF) is reversed bit by bit. Note: The data is a fixed 3 bytes (the high byte is in front, the low byte is in the back, if the data valid byte is less than 3 bytes, the invalid bit is filled with 0)

3.1.3 Write Operation Timing

The serial write sequence is performed as follows. The frame identification byte {0xA8}

indicates that the data communication operation is writing data. ADDR is the address of the register that needs to write data. The MCU will prepare the data bits that need to be written into the BL0942 before the falling edge of SCLK, and start shifting in the register data at the falling edge of the clock of SCLK. All remaining bits of the register data are also shifted left on this falling edge of SCLK (Figure 13).

BL0942

	2 内置时钟免校准计量芯片
SDI ADDR[7:0]	DATA_H,ML[7:0] CHECKSUM[7:0]
SDOs	

Figure 13

3.1.4 Read Operation Timing

During the data read operation of BL0942 , at the rising edge of SCLK , BL0942 outputs the corresponding data bit to the SDO logic output pin, and the SDO value remains unchanged during the next SCLK is 1 , that is, in the next On the falling edge, an external device can sample the SDO value. When performing data read operation, MCU must first send a read command frame.

When BL0942 is in the communication mode, the frame identification byte {Ox58} indicates that the data communication operation is read data. Then the following byte ADDR is the address of the target register to be read. After receiving the register address, BL0942 begins to shift out the data in the register on the rising edge of SCLK (Figure 14). All remaining bits of the register data are shifted out on subsequent SCLK rising edges. Therefore, on the falling edge, the external device can sample the output data of the SPI. Once the read operation is complete, the serial interface re-enters communication mode. At this time, the SDO output enters a high-impedance state on the falling edge of the last SCLK signal.

3.1.5 SPI Interface fault tolerance mechanism

The soft reset function of the SPI interface can reset the SPI interface independently by sending 6 bytes of OxFF through the SPI interface.

3.2 UART

- via pin SEL option, with the SPI Multiplexing, SEL=0
- work in slave mode
- Half-duplex communication, the baud rate can be configured as 4800bps, 9600bps, 19200bps, 38400bps by software and hardware

BL0942

- 8-bit Data transfer, no parity, stop bit 1
- Support packet reading
- TSSOP14L The package can support device chip select function, the hardware chip select address pins are [A2_NCS, A1], optional device 0~3. Can support 4 Sheet BL0942 hang on UART Data communication on the bus, only occupying the MCU A UART of interface.

3.2.1 Baud rate configuration

Use mode register $\mathsf{UART_RATE_SEL}\;($ $\mathsf{MODE[9:8]}\;)$ and pin $\mathsf{SCLK_BPS}\; \mathrm{for}$ baud rate configuration.

0x19	MODE	Operating Mode					
			Regist	er			
No.	name	default value	default value description				
				00	SCLK_BPS pin = 0: 4800bps		
			b00 UART communication	00	SCLK_BPS pin = 1:9600bps		
[9:8]	UART_RATE_SEL	0b00		01	Same as OO		
			baud rate selection	10	19200bps		
				11	38400bps		

The RATE_SEL reset value is 0x0 every time the chip is powered on , and the baud rate is determined according to the pin SCLK_BPS at this time.

3.2.2 format per byte

Take the baud rate **=4800bps** as an example:

Start bit low level duration t1=208us

Valid data bit time lasts t2=208*8=1664us

Shanghai Belling Corp., Ltd.

Stop bit high level duration t3=208us

3.2.3 write timing

The host UART write data sequence is shown in the figure below. The host first sends the command byte $\{1,0,1,0,1,0,A2,A1\}$, and then sends the register byte (ADDR) that needs to be written into the data, and then Send data bytes in sequence (low byte first, high byte later, if the data valid byte is less than 3 bytes, the invalid bit is filled with 0), and finally the checksum byte.

BL0942

{1,0,1,0,1,0,A2,A1} are frame identification bytes for write operation. Suppose

{A2,A1}=10, the device address is 2, and the frame identification byte is 0xAA. ADDR is
the internal register address of BL0942 corresponding to the write operation.

CHECKSUM bytes are ({1,0,1,0,1,0,A2,A1}+ADDR+DATA[7:0]+DATA[15:8]+DATA[23:16]) & 0xFF negated.

3.2.4 read timing

The host UART read data sequence is shown in the figure below, the host first sends the command byte {0,1,0,1,1,0,A2,A1}, and then sends the register address byte (ADDR) to be read, and then BL0942 sends the data bytes in sequence (the low byte comes first, the high byte follows, if the data valid byte is less than 3 bytes, the invalid bit is filled with 0), and finally the checksum byte.

 $\{0,1,0,1,1,0,A2,A1\} \text{ is the frame identification byte of the read operation, assuming that} \\ Shanghai Belling Corp., Ltd. V1.05 40/31 \\ \label{eq:alpha}$

{A2,A1}=10, the device address is 2, and the frame identification byte is Ox5A.

BL0942

ADDR is the internal register address of BL0942 corresponding to the read operation ;

 $\label{eq:checksum} CHECKSUM \mbox{ bytes are } (\mbox{ \{0,1,0,1,1,0,A2,A1\}} + \mbox{ADDR} + \mbox{DATA} \mbox{[15:8]} + \mbox{DATA} \mbox{[23:16]}) \mbox{ & 0xFF negated.} \\$

Note: The device address of SSOP10L package is 0, that is, {A2,A1}=00.

3.2.5 Timing description

	illustrate	Min	type	Max	unit
t1	Interval time between MCU sending bytes	0		20	М
t2	During the read operation, the MCU sends the register address to the end of the BL0942 sending byte Intervals		150		u
t3	Interframe time	0.5			u
t4	Interval time between bytes sent by BL0942		0		u

BL0942

3.2.6 packet sending mode

Through the command " {0,1,0,1,1,0,A2,A1}+0xAA", BL0942 will return a full electric parameter data packet. A total of 22 packets were returned

BL0942

bytes, when using ${\bf 4800bps}\,,$ it takes about

48ms. Full electric parameter

checksum= (({0,1,0,1,1,0,A2,A1} + 0x55 + data1_I + data1_m + data1_h +......) & 0xff) and invert

3.2.7 **UART** Interface Protection Mechanism

Frame timeout reset, if the byte-to-byte interval time exceeds 20ms, the UART Interface reset.

BL0942

- Manual reset, UART received more than 32 consecutive " O", UART Interface reset.
- Frame identification byte or checksum If the byte is wrong, the frame data is discarded.

Note: In multi-chip communication in UART mode, each time a frame is sent, wait for a frame timeout or send a manual reset before sending the next frame.

4 order information

BL0942-X X=SSOP10L: SSOP10L package

X=TSSOP14L: TSSOP14L package

5 silk screen information

"YY" represents the last two digits of the packaging year

" WW " stands for package week, 01-52 weeks

" ZZ " stands for packaging factory

" #" stands for space

4th to 8th letters or numbers of the $\rlap{''}$ SSSSS $\rlap{''}$ card number (LOT NO.)

6 encapsulation

Moisture sensitivity level MSL 3 Warranty period of two years Packing method SSOP10L taping packaging Min. packing 3000
